SUMMARY

Final-year Information Science and Engineering student working across cloud infrastructure, networking, and applied AI – connecting them to solve one problem rather than treating them as separate tracks (e.g. using systems-level networking knowledge to debug a live infrastructure issue, and multi-model orchestration to build an end-to-end AI pipeline). Nutanix Certified Associate (NCA 6). Comfortable scoping ambiguous problems, picking the right tool for the job, and shipping working prototypes under time constraints.

EDUCATION

Nitte Meenakshi Institute of Technology <i>Bachelor of Engineering – Information Science and Engineering</i> CGPA: 8.57	Bengaluru, Karnataka 2023 – 2027
Government Pre-University College <i>Pre-University Course (12th Standard) – Science</i> 93.33%	Sagar, Karnataka 2021 – 2023
Pragathi Composite High School <i>Secondary School Leaving Certificate (10th Standard)</i> 95.2%	Sagar, Karnataka 2021

TECHNICAL SKILLS

Languages: C, Python, Java, JavaScript
Cloud & DevOps: AWS, GCP, Docker, Git/GitHub
Networking & Systems: TCP/IP, VLANs, Linux Administration, Open vSwitch
AI / ML: YOLO Object Detection, Vision-Language Models (Qwen-3), Model Fine-Tuning
Core CS: Data Structures & Algorithms, OOP, Serverless Architecture, Systems Design

PROJECTS

- INDRA – Multimodal Traffic Analysis System** | *Qwen-3 VL-4B, YOLOv8m, Python, PyTorch* 2026 – Present
- Designing an end-to-end AI pipeline for Indian road traffic surveillance in a 4-member team, chaining a custom-trained YOLOv8 plate detector, YOLOv8m for vehicle tracking, and Qwen3-VL-4B for OCR, helmet classification, and scene reasoning.
 - Added image enhancement preprocessing and real-time multi-object tracking to close accuracy gaps found during real-world testing.
 - Validated on real Bengaluru and Delhi dashcam clips — >70% plate recall, full 60s videos processed offline in 16–40 min/clip depending on traffic density.
- Multi-Tenant Network Isolation** | *Open vSwitch, Docker, Linux Namespaces, Python* | [GitHub](#) July 2026
- Built a multi-tenant network isolation environment with Open vSwitch and Docker on WSL2 Ubuntu, simulating VLAN-based segmentation with a hard security boundary between tenants.
 - Configured OVS access/trunk ports per tenant, enforced strict L2 isolation across 3 tenants, and diagnosed a real gateway routing failure via tcpdump before fixing it with Linux policy-based routing.
 - Built a Python SDN dashboard querying OVS CLI tools in real time – port state, traffic counters, MAC tables, and automated cross-tenant isolation checks.
- Drop-IT** | *AWS Lambda, API Gateway, S3, Python* | [GitHub](#) March 2026
- Designed a serverless file-sharing platform on AWS Lambda and S3, enabling secure transfers up to 10 MB without infrastructure to manage.
 - Implemented pre-signed S3 URLs for time-limited secure access and integrated API Gateway for RESTful frontend-backend communication.
 - Collaborated in a 2-member team using GitHub for version control.

CERTIFICATIONS & COURSES

Nutanix: Nutanix Certified Associate (NCA) 6 – Multicloud Infrastructure	2026
AWS: AWS Cloud Foundations, AWS Cloud Architecting	2025
Google Cloud: Google Cloud Career Launchpad – Cloud Engineer Track	2025
Cisco Networking Academy: Networking Basics, JavaScript Essentials 1	2025
Infosys Springboard: Complete UNIX & Linux OS Fundamentals, Database and SQL	2025

ACHIEVEMENTS & EXTRACURRICULARS

- Selected among 48 students at NMIT for the exclusive NMIT × Nutanix NCA Certification Program through a competitive selection process.
- Built a functional prototype under time constraints at the Odoo × DataWiz NMIT Hackathon.
- Technical Member, CloudZilla – NMIT’s cloud computing club.
